

PRODUCT MODELING SPECIFIC PRODUCT PARAMETERS

GENERAL NAVIGATION

After logging into the WebSource Configurator the Administration page is displayed. The left hand has a link (Admin Home) and drop downs:

- Global Parameters
- Attributes/Sequences
- Products/Online Catalog
- Workflow/Approvals
- Users/Groups
- Quotations/Projects
- Priorities
- CRM Application Parameter Setup
- Add-Ons

Adding, Deleting or Modifying a Product is started from the Product Administration page, which is opened by selecting the **Products** link under the **Products/Online Catalog** drop down. In the center of the screen will be a list of the Categories, as shown in Figure 12-1.

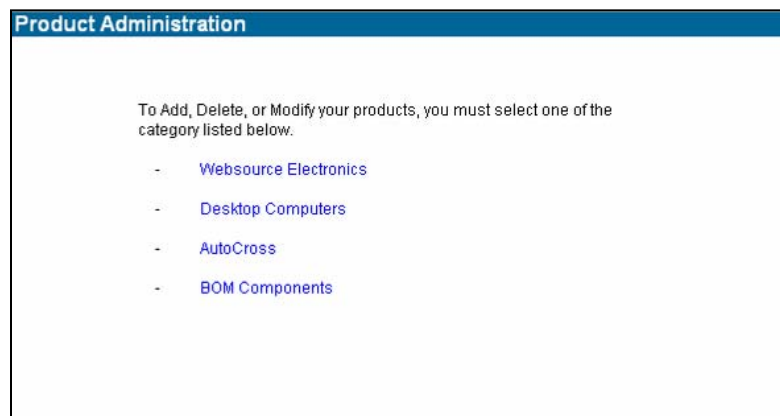

Figure 12-1 - Product Administration – Categories

Selecting the Category from this list will bring up the Product Administration page that displays any current products for that Category as shown in Figure 12-2.

Figure 12-2 - Product Administration – Existing Products

From here existing products can be modeled, updated, and additional Products can be **Added**. Displayed under the Category is the **Category Description**, which was set up in **Category Definition** (see Chapter 2). The left column displays the existing Products created for this category. The right column displays the **Rank** which is set up in the **Product Definition** page. This value determines what order the products are shown to the user. Clicking any **Product Name** in the list will allow editing of that Product. Clicking **Add a Product** will open a blank **Product Definition** page to add a new product (see Chapter 13).

When a Product is selected from the Products Administration page, a new drop down menu appears under **Current Products**. This menu is not accessible until a Product is chosen for modeling. The links listed in the menu only apply to the product that was selected. To select a different Product, select the **Products** link under **Products/Online Catalog**, select the Category, and the Product.

In order to allow users to upload their Style Sheets (CSS) files, styles/userstyles directory must be writable. Then change global.asa file. In Application_OnStart section add the line **application("ALLOW_USER_STYLE_UPLOAD") = true**. Replace "true" with "false" to prevent user uploading style sheets.
